This week we will wrap up our review of different federal agencies with a cybersecurity mission. Last week we looked at how DHS and FBI work to protect and support U.S. interests in the face of cyber-threats. Today we will look at HHS’s role as well as the other agencies that contribute legal authorities and cyber-capabilities to the U.S. government’s “defensive” cyber-mission. We will also do a quick overview of the agencies responsible for the government’s “offensive” activities in cyber-space and give you a sense of the doctrine that helps determine how it is applied.

HHS has three cybersecurity missions that have been authorized and funded by Congress – defend its own networks and data; support the health care sector; develop and enforce regulations. The new Health Cybersecurity and Communications Center (HCCIC) has a role to play in executing responsibilities in line with all three mission areas. As we described in a previous edition of the newsletter, the HCCIC will serve to integrate SOC functions across the different HHS bureaus, lend health sector specific expertise to threat intelligence analysis at the six cyber centers (specifically the NCCIC), and inform the long-term development of regulatory policy to reflect the nature of the cyber threat against the healthcare sector.

Planning for public health emergencies is conducted within HHS by the Assistant Secretary for Preparedness and Response (ASPR), who is also responsible for carrying out the role of “sector-specific agency.” The role of a sector specific agency (created under PPD-21) is to support the resiliency of the health care sector from within the federal government. This includes lending sector relevant expertise to other agencies around the government, such as DHS, the FBI, or the intelligence community, as well as serving as an interface between the government and private sector personnel during both steady-state and incident response.

HHS’ regulatory authorities sit within a few different offices – the Office of Civil Rights (OCR) and the Food and Drug Administration (FDA), as well as the Office of the National Coordinator for health IT (ONC) and the Centers for Medicare & Medicaid Services (CMS). Congress gave OCR the authority to implement and enforce HIPAA, which sets expectations for how health organizations protect patient information. FDA sets the regulations by which medical devices must comply and has issued both pre- and post-market guidance for the cybersecurity of medical devices. ONC and CMS are not regulators in the traditional sense, but both oversee federal subsidy programs and set “regulatory” requirements that healthcare organizations must meet in order to receive benefits. ONC (for “Meaningful Use”) and CMS (for Medicare/Medicaid), both expect participants to appropriately manage cyber risks.
Beyond DHS, FBI, and HHS, there are a few other health sector relevant agencies that play a role in cybersecurity.

The Department of Commerce sets standards for federal government agencies through the National Institute of Standards and Technology (NIST), which in recent years has extended that expertise to develop frameworks of standards and best practices for private entities to adopt (most notably the CSF, but more recently the NICE Framework). NIST also funds and conducts research in cybersecurity, including applied research at the National Cybersecurity Center of Excellence, as well as managing the National Vulnerability Database. The Department of Commerce is also responsible for the National Telecommunications & Information Administration, which primarily manages spectrum allocation for the government, but also has broad responsibility for Internet policy and has in recent years led a number of multi-stakeholder processes to inform development of that policy. One current multi-stakeholder process is related to the security of Internet of Things devices.

The Federal Trade Commission (FTC) and Federal Communications Commission (FCC) are both regulatory agencies with purview over cybersecurity matters and a voice in government policy development. FTC has authority to enforce a number of consumer protection laws, including those related to unfair and deceptive practices. This authority has been used recently against companies such as UBER, which “failed to live up to its claims” of monitoring access to rider and driver data and appropriately securing that data. The FCC is responsible for ensuring the availability and resilience of the nation’s telecommunications infrastructure and in that role sets regulatory expectations of telecommunications companies, as well as working with DHS in a sector-specific capacity.

The National Security Agency (NSA) also plays a role in the government’s defensive mission. The Information Assurance Directorate (IAD) is responsible for securing the government’s national security systems – in other words, those that conduct classified activity or store classified information. NSA is also authorized, under certain circumstances to lend expertise to critical infrastructure companies in the form of technical assistance. This technical assistance is usually obtained through a request made by HHS, in its role as sector-specific agency, or DHS.

To conduct this defensive mission, NSA draws on the cryptographic and cyber-exploit capabilities that it has developed for its role in signals-intelligence and offensive cyber operations. NSA collects foreign “signals” related to certain foreign individuals of interest or foreign-born threats against U.S. persons. NSA also supports Cyber Command and other DOD missions as they look to conduct network operations against military targets. Cyber Command is currently led by Admiral Rogers, who is “dual hatted” and also leads NSA.

DOD’s cyber-mission is, as you would imagine from such a large organization, multi-faceted. Military services such as the Army and Navy utilize cyber capabilities to conduct in theatre intelligence collection and support kinetic operations. But DOD also supports the defense industrial base (DIB) as a sector of the economy’s critical infrastructure. In fact, one of DOD’s cyber centers – DC3 – may serve as an appropriate model as HCCIC looks to support the health care industry. And the Air Force Office of Special Investigations has the capabilities and authorities to investigate and mitigate cyber-threats against DOD, the DIB, and the U.S. Government. Importantly for the health care sector, this include the Defense Health Agency and the health care delivery units within each service branch.

CIA puts cyber capabilities to use as they conduct intelligence collection and other foreign operations in line with their authorized mission.
The National Security Council’s Cybersecurity Directorate directly supports the President’s ability to utilize the government’s cyber capabilities and authorities when making decisions and directing actions. To do that, NSC coordinates agency actions and leads processes to develop supporting policies and procedures. In certain cases, such as its role in incident response – which we previously discussed, the NSC will actually lead operational decision making. One example of the NSC exerting operational leadership during steady state situations is the Vulnerability Equities Process, which determines when and how the government will disclose vulnerabilities in commercial software and hardware.

That wraps up our overview of all the different moving pieces within the government’s cyber-apparatus. Next week we will plan to look at all the cybersecurity legislation that may come before Congress this fall.

*Hot Links* – NH-ISAC is currently tracking activity related to Hurricane Harvey.

FDA today releases its final guidance on the interoperability of medical devices. This guidance considers security, but does not depart in scope or tone from the premarket cybersecurity guidance that FDA has previously released. For example, “FDA recommends that manufacturers include ... a particular focus on ... security issues introduced when including an electronic interface.” This seems like the reasonable, if not groundbreaking, approach that one would hope the regulators put forward. Here’s a blog post from the lead author of the guidance.

*The Week Ahead* –

*Administration activity* –

--NTIA will host a meeting of its multi-stakeholder process on the security of IoT devices. This one takes place in New York and looks at upgradability and patching. (9/12)

*Congressional Activity* – The House and Senate are back in session after the August recess. Lots of activity in committee hearings.

Wednesday, September 6:

--Confirmation hearing – Matthew Bassett to be HHS Assistant Secretary for Legislation (Senate Finance)
--Hearings to examine the history and current reality of the United States health care system. (Senate Homeland Security)
--Stabilizing Premiums and Helping Individuals in the Individual Insurance Market for 2018: Health Care Stakeholders (Senate HELP)
Thursday, September 7:
--Appropriations Hearing – HHS 2018 Appropriations markup (Senate HELP)
--Stabilizing Premiums and Helping Individuals in the Individual Insurance Market for 2018: Health Care Stakeholders (Senate HELP)
--Hearing to examine Navy Readiness in light of the USS Fitzgerald and USS McCain (House Armed Services)
--Challenges of recruiting and retaining a cybersecurity workforce (House Homeland)

Tuesday, September 12:
--Hearing on “The Dynamic Gains from Free Digital Trade for the U.S. Economy” (Joint Economic Committee)
--Resiliency: The Electric Grid’s Only Hope (House Science, Space, and Technology)

Conferences and Webinars –
--Basic Best Practices in Cybersecurity – Minnesota (NH-ISAC) (9/6)
--Medical Device Workshop at Medtronic – Mounds View, MN (NH-ISAC) (9/7)
--HIMSS Healthcare Security Forum (9/11-13)
--NTIA Security of IoT devices multi-stakeholder process (9/12)
--Billington CyberSecurity Summit (9/13)
--Basic Best Practices in Cybersecurity - Alabama (NH-ISAC) (9/15)
--Biotech/Pharma Security Workshop at MSD, Prague (NH-ISAC) (11/7)
--NH-ISAC Fall Summit – Cyber Rodeo (11/28-30)
